### **Epigenetics**

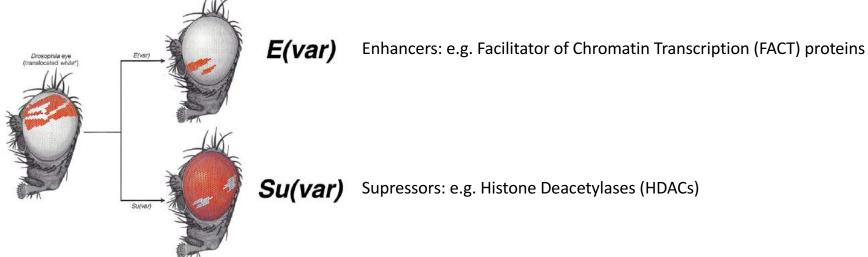

Máté Varga mvarga@ttk.elte.hu

# Position-effect variegation: a matter of chromatin accessibility

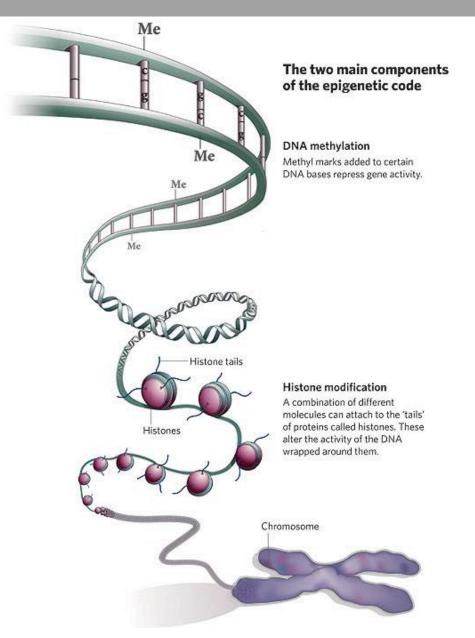

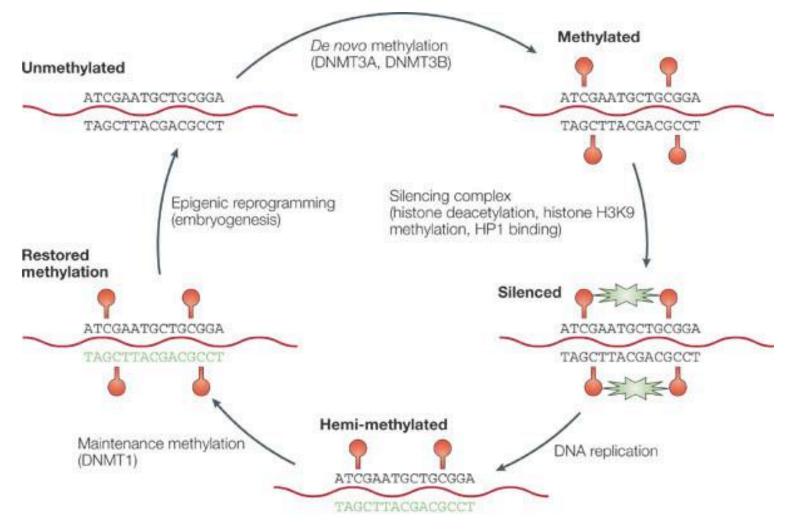

### **Epigenetic regulation of gene expression**

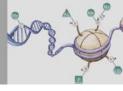

### **DNA** methylation in CpG positions

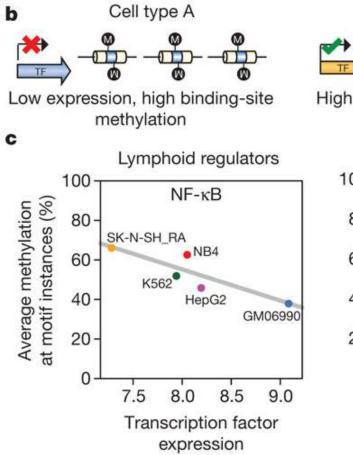

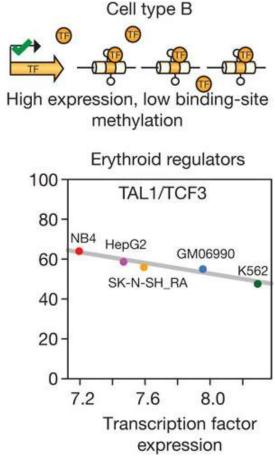

Nature Reviews | Cancer

### **DNA** methylation can be a passive process

 - if DNA methylation would be an active process, methylation levels would be independent of TF concentration

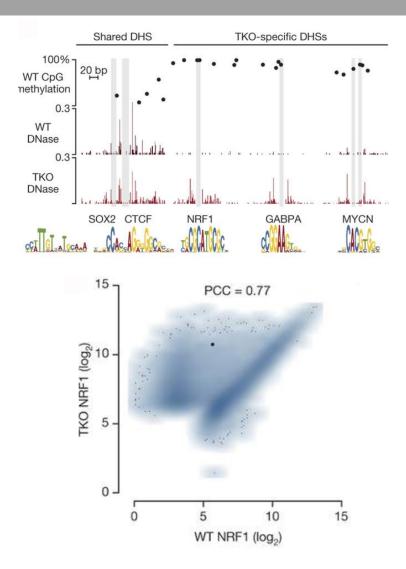

- what we observe, however, is that the higher the expression for a TF, the less methylation can be observed at its binding sequence

- this suggests that methylation is passive, and occurs wherever DNA is not bound by other factors

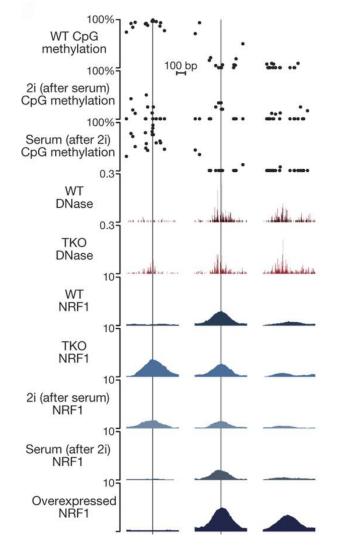

(Thurman et al. (2012) Nature)

### Some TFs are methylation sensitive

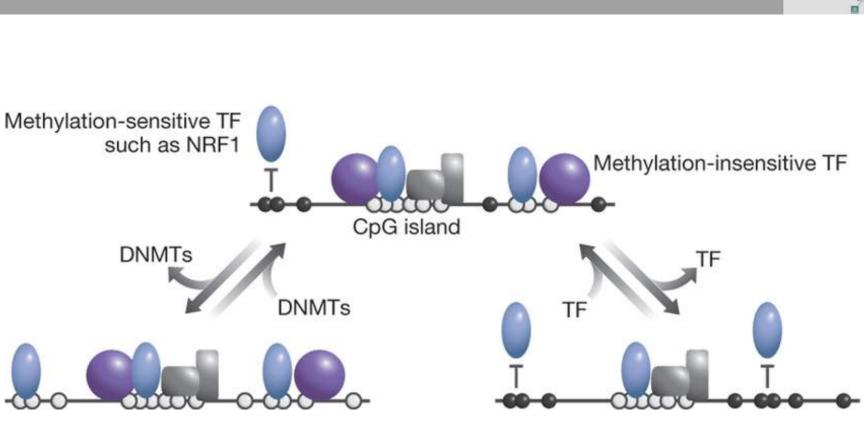

- in the absence of DNMT function, TFs can bind previously methylated positions

- after new methylation, these NRF1 sites disappear

(Domcke et al. 2015 Nature)

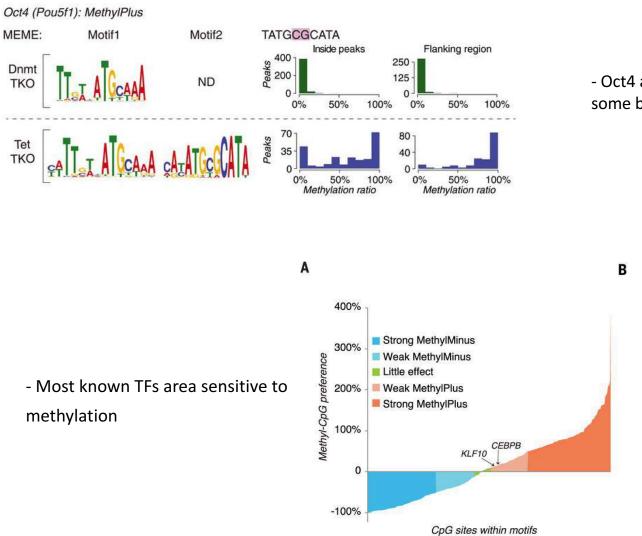

### Some TFs are methylation sensitive

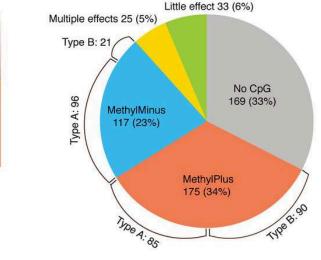

- Binding of methylation-sensitive TFs can happen after DNMT-function impairment, or as the result of the binding of methylation-insensitive TFs (these induce local demethylation)

(Domcke et al. 2015 Nature)

### Some TFs are methylation sensitive

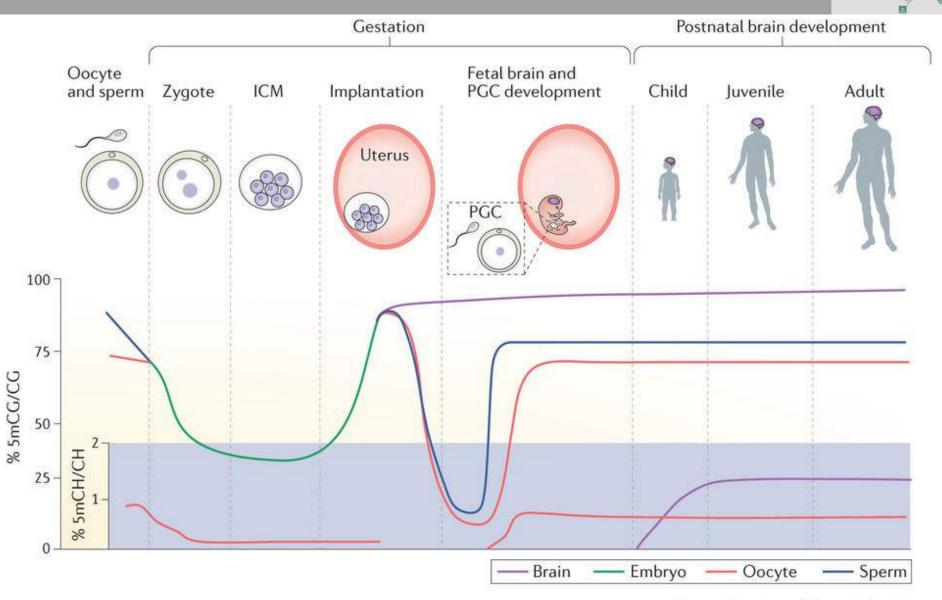

- Oct4 actually *prefers* methylation at some binding sites

(Yin et al. 2017 Science)

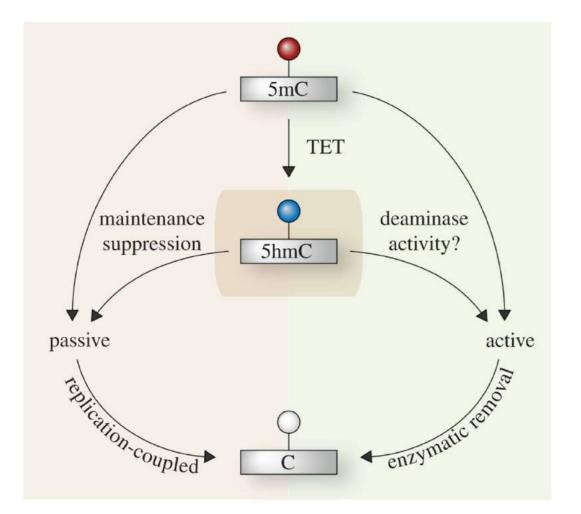

### **Changes in methylation during development**

Nature Reviews | Neuroscience (Ciernia and LaSalle 2016 Nat Rev Neurosci)

### A possible mechanism for active demethylation

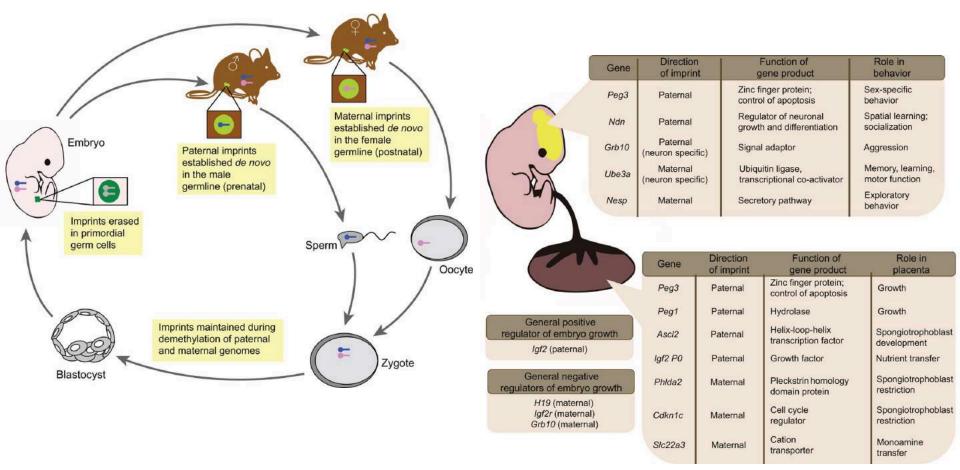

- The 5mC-5hmC conversion could be the first step in the passive demethylation of the paternal genome at the beginning of development
- Active (Tet-dependent) demethylation occurs in PGCs

(Hackett and Surani 2012 Phil Trans Roy Soc B)

### The role of parental imprinting in development

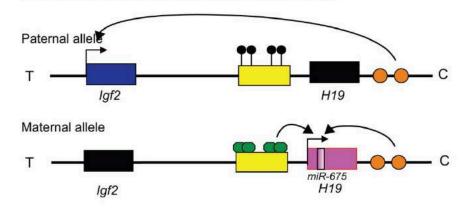

#### (Plasschaert and Bartolomei 2014 Development)

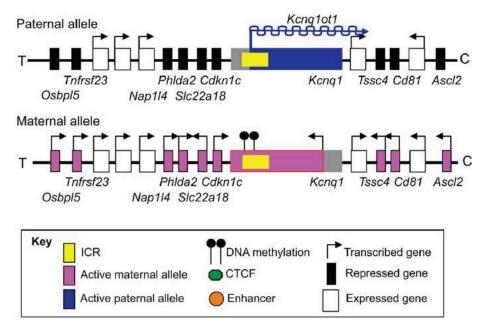

### The mechanism of parental imprinting

A Insulator model of imprinting: the H19/Igf2 locus

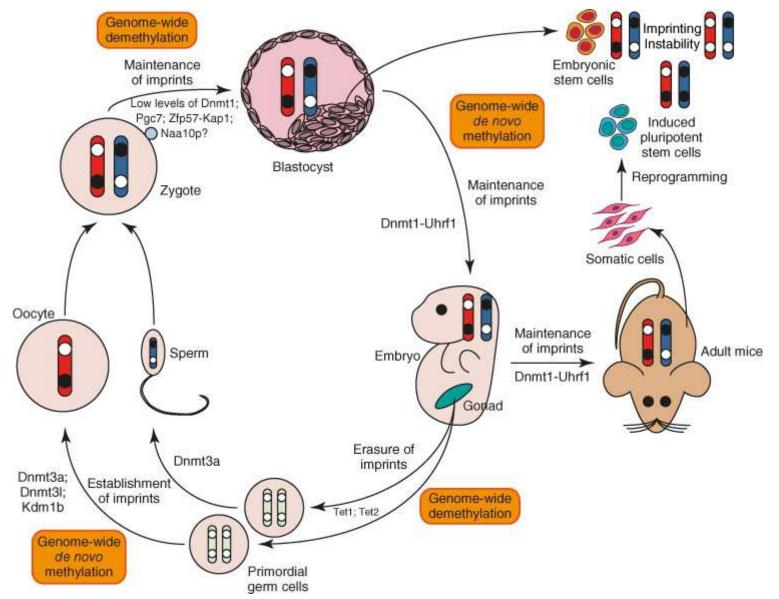

B ncRNA model of imprinting: the Kcnq1 locus

(Plasschaert and Bartolomei 2014 Development)

# How parental imprinting can be conserved during epigenetic reprogramming?

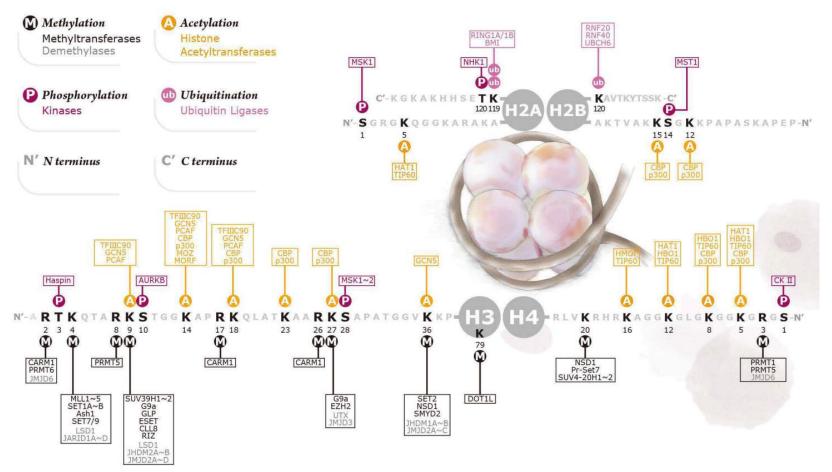

(Brandao et al. 2018 eLS)

### **Epigenetic histone modifications**

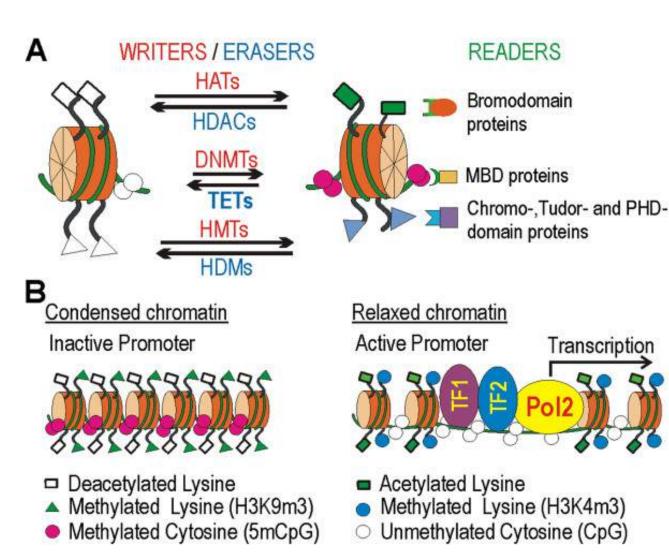

Inactive state: acetylation (Ac) - lysine (K) 12 (histone 4 - H4) and methylation (Me) K9, K27 (H3)

Active state: acetylation - K9, K14 (H3), K5 (H4), methylation - K4 (H3), arginine (R) 3 (H4)

### **Epigenetic histone modifications**

**HATs** = histone acetyl transferases

HDACs = histone deacetylases

**DNMTs** = DNA methyltransferases

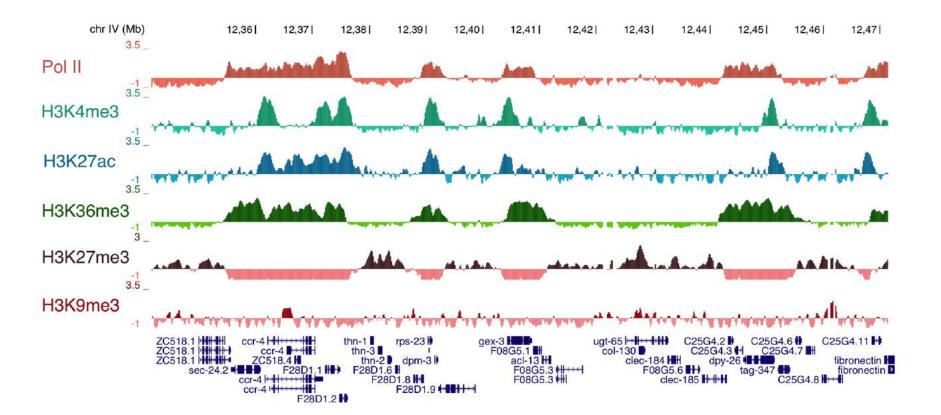

**TETs** = ten-eleven translocation enzymes

**HMTs** = histone methyl transferases

**HDMs** = histone demethylases

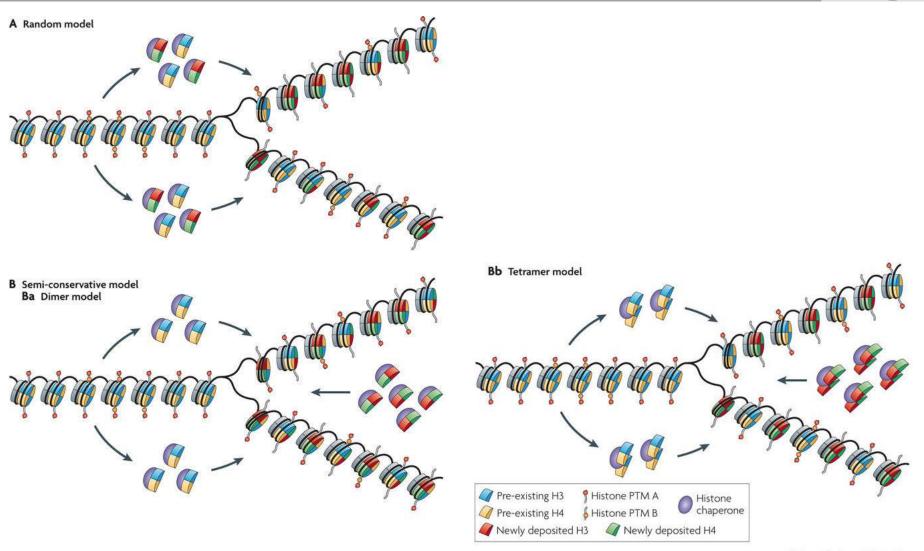

(Glant et al. 2014 BMC Medicine)

### **Epigenetic histone modifications and gene expression**

#### (Wormbook)

### Inheritance of epigenetic histone modifications

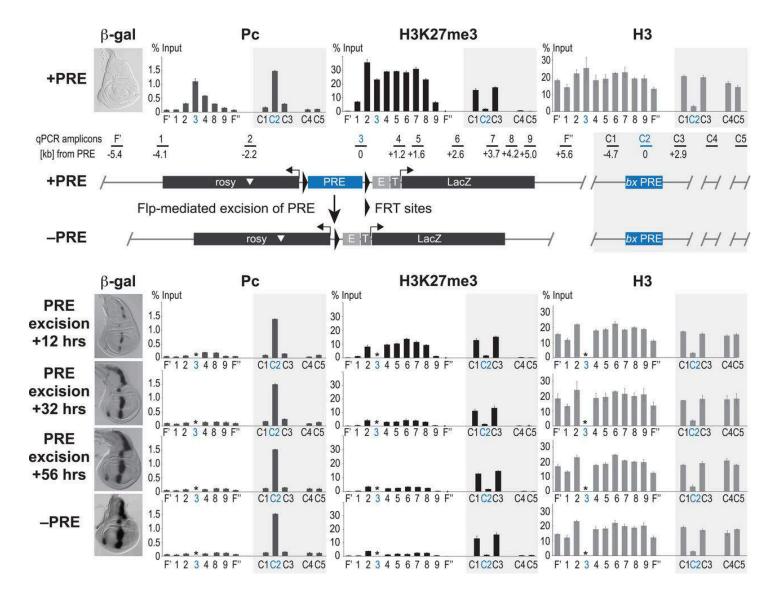

Nature Reviews | Genetics

#### (Margueron and Reinberg 2010 Nat Rev Gen)

# Inheritance of epigenetic histone modifications: the role of PcG proteins

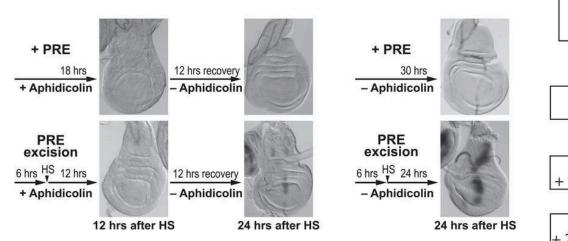

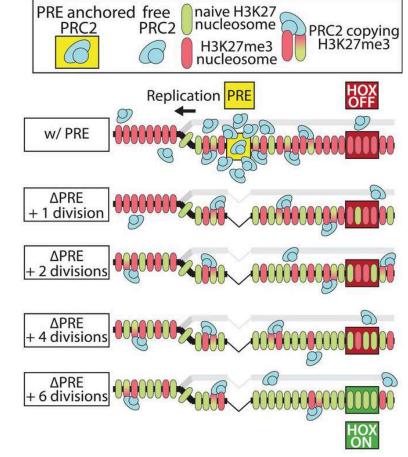

(Laprell et al. 2017 Science)

# Inheritance of epigenetic histone modifications: the role of PcG proteins

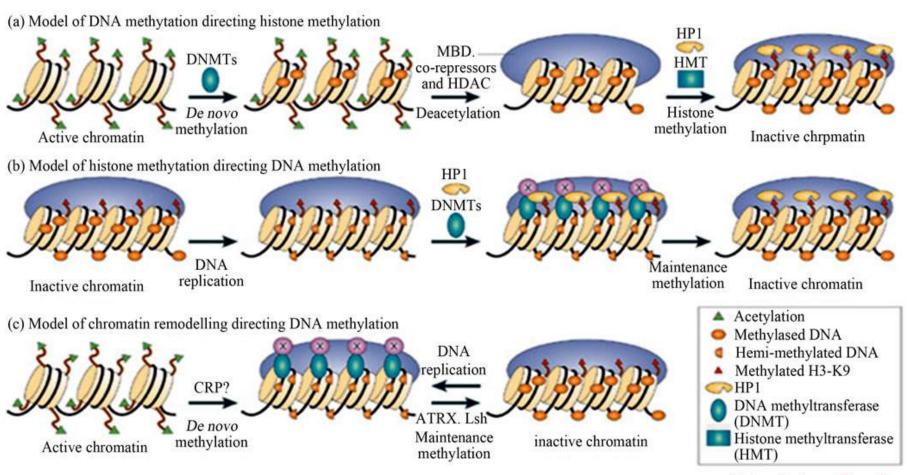

- Repressive histone-modifications are lost during cell divisions

(Coleman and Struhl 2017 Science, Laprell et al. 2017 Science)

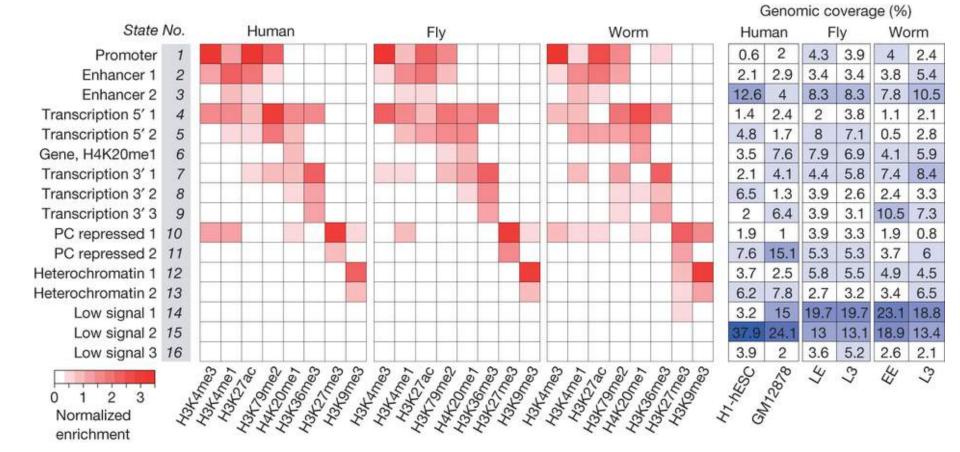

### Repressive epigenetic signals can catalyze each other

Nature Reviews I Genetics

### Promoter modifications are similar across Metazoa

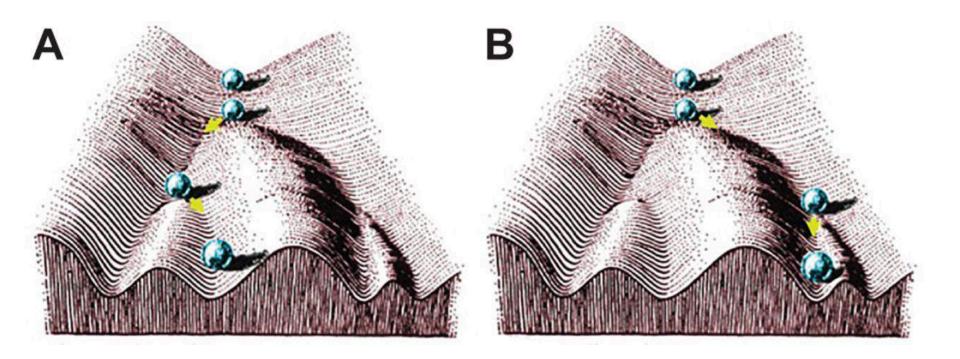

(Ho et al., 2014 Nature)

### **Conrad Waddington's epigenetic landscape**

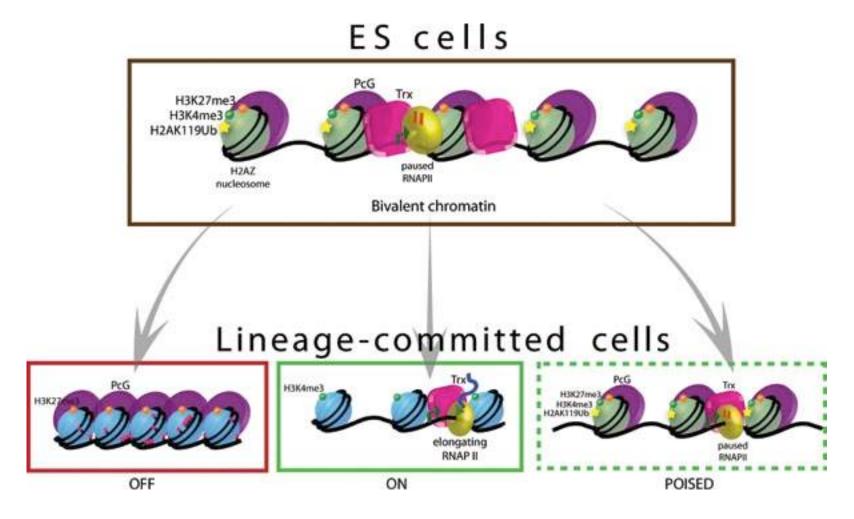

- Cells in different tissues express different sets of genes, but they all have the same genome
- Epigenetics has a major role in deciding which genes are transcribed at a given timepoint in a cell

### **Bivalent epigenetic modifications**

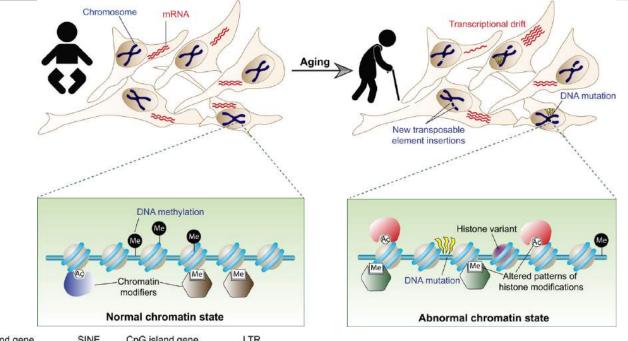

- most often occur at developmental genes

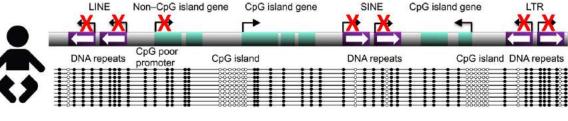

- the bivalent modifications get resolved over time

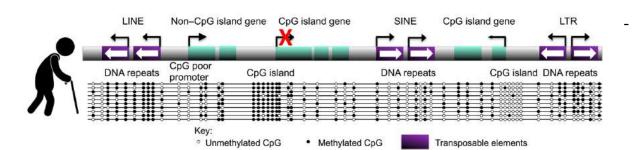

### The epigenetics of aging

- in *general* heterochromatin loosens up during aging, and there are less repressive epigenetic modification

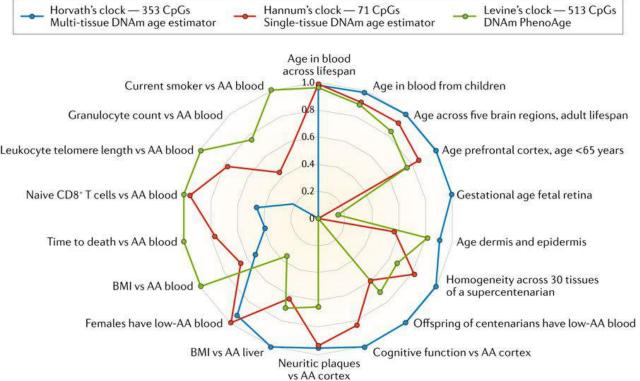

- While most sites become hypomethylated, there are some that will be hypermethylated (and consequently some genes are silenced)
- Transposons become overactive, with deleterious consequences

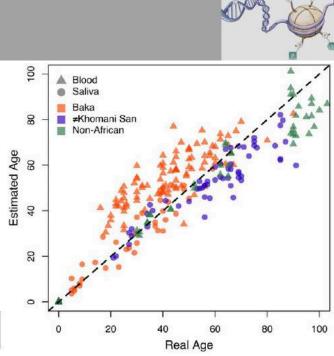

(Pal and Tyler, 2016 Science Adv)

### **Epigenetic clocks**

- the right combination of hypo- and hypermethylated sites can predict the age of the sample tissue with high accuracy

(Gopalan et al., 2017 Genetics)

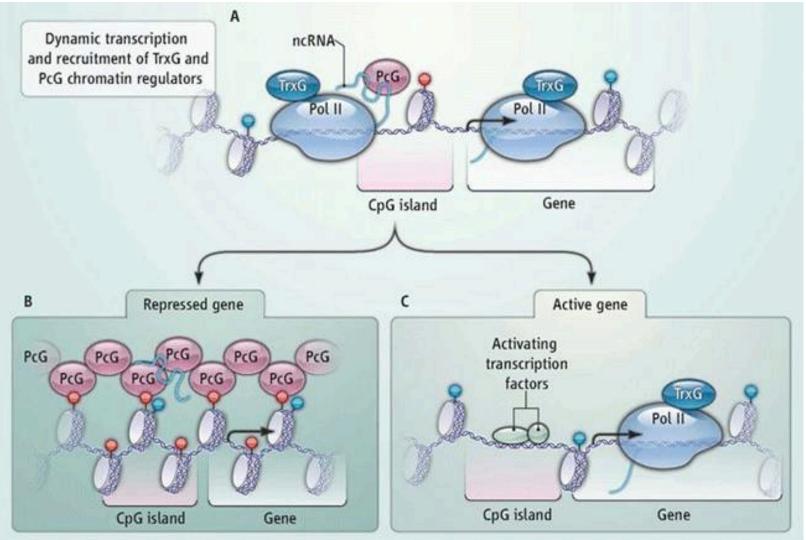

(Horvath and Raj, 2018 Nat Rev Gen)

### **Transcription can be repressive**

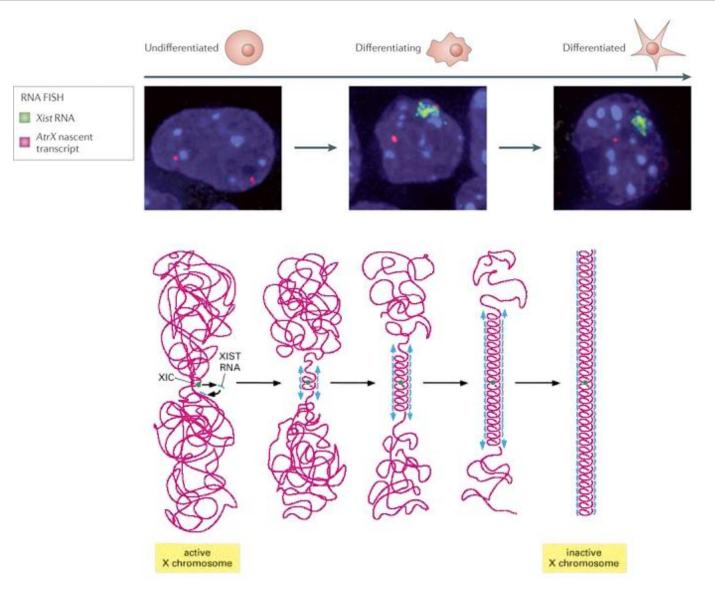

(PcG = Polycomb Group Protein; TrxG = Trithorax Group Protein)

(Guenther and Young (2010) Science)

### X chromosome inactivation: a classic example for repressive transcription

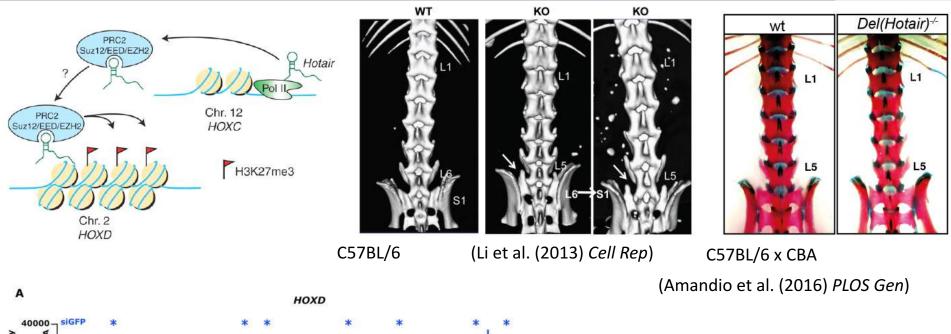

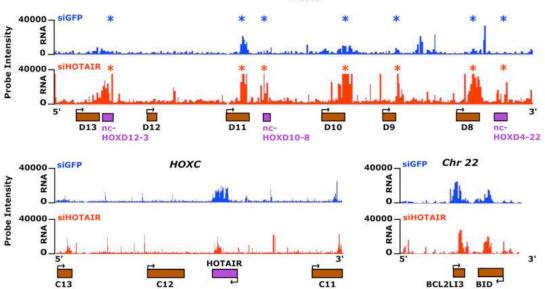

(Augui et al. (2011) Nat Rev Gen))

### **Could IncRNAs silence genes in other chromosomes?**

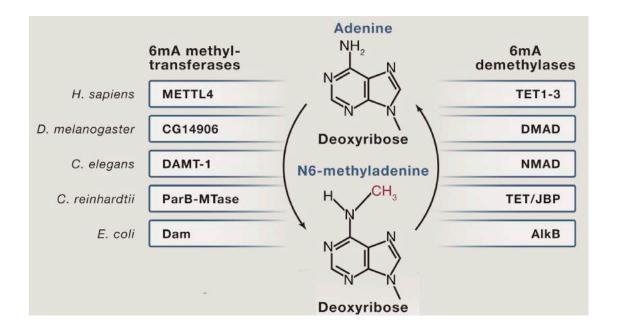

BUT: Denis Duboule's group has knock out the whole HoxC cluster before (including *HOTAIR*) with no phenotype. How is this possible?

(Rinn et al. (2007) Cell)

### N6-adenin methylation (m6A): it exists, but what is the role?

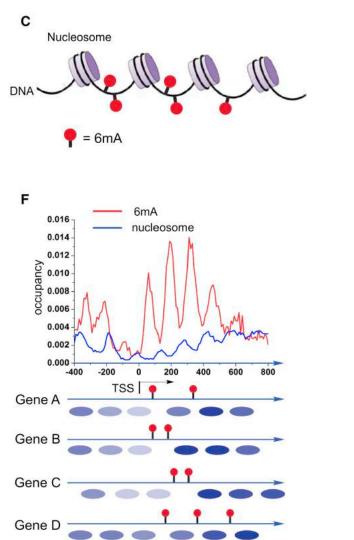

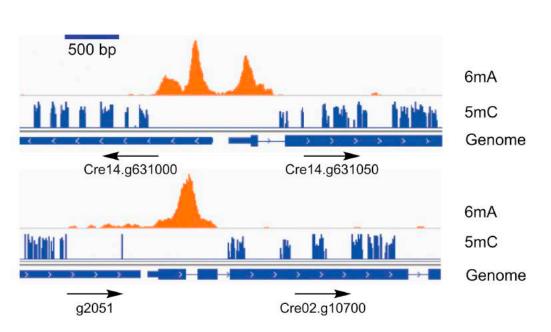

In prokaryotes m6A methylation is essential (m5C is not observed), but recently has been detected in eukaryotes as well.

(Heyn and Esteller (2015) Cell)

### m6A DNA-methylation in the regulation of *Chlamydomonas* gene expression

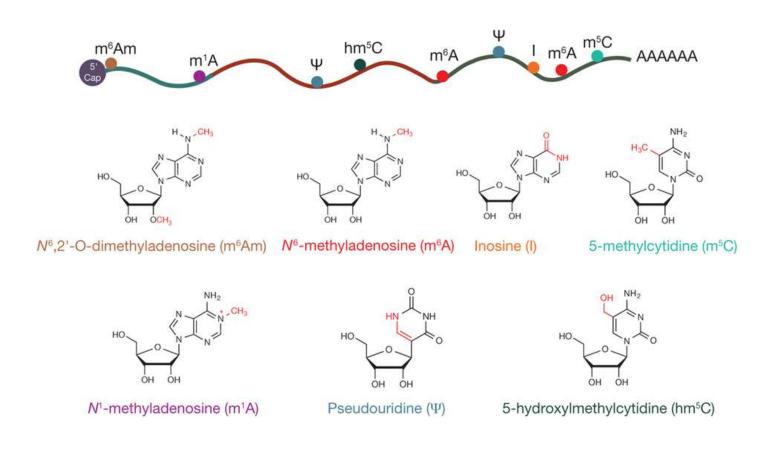

- m6A is characteristic for the linker regions of *Chlamydomonas,* in the proximity of the TSS (m5C is seen in the inside of the genes)

(Fu et al. (2015) Cell)

### **Epitranscriptome: posttranscriptional modification of the RNA**

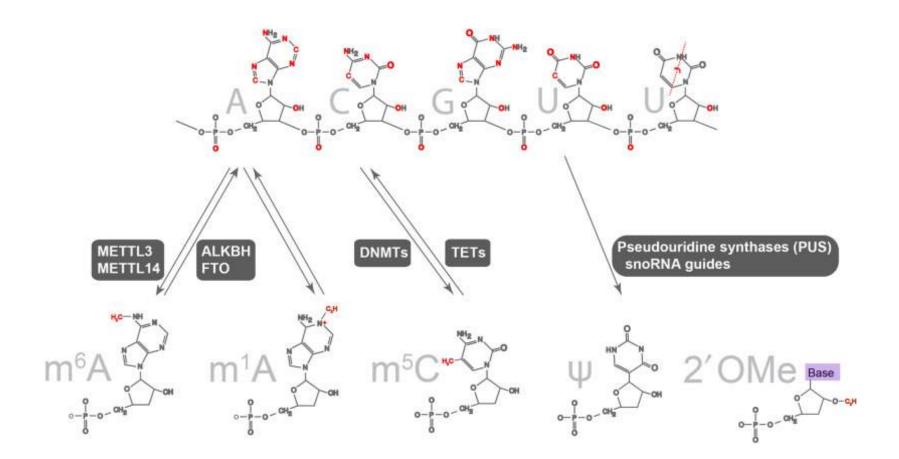

- Posttranscriptional modification can affect RNA stability

#### **Epitranscriptomic modifications are dynamic**

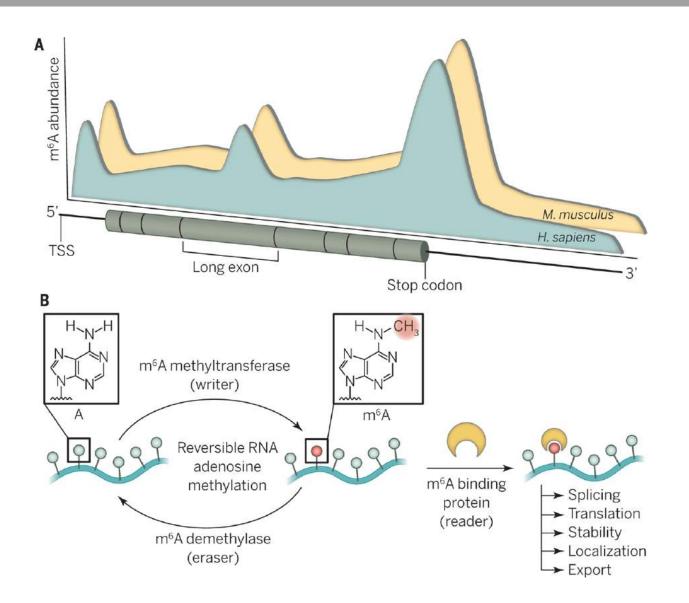

- We can distinguish "writer", "eraser" and "reader" proteins

#### m6A modifications of the primary mRNA

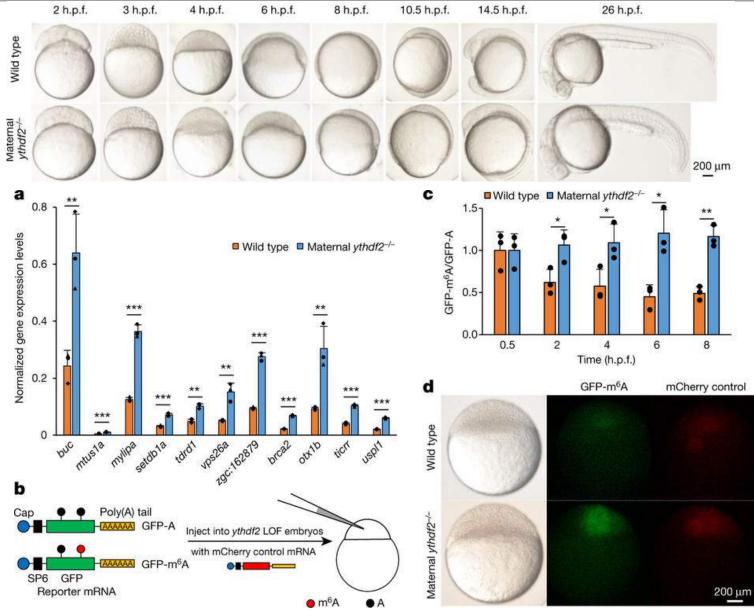

(Dominissini, 2014 Science)

### m6A regulates the stability of maternal transcripts during zebrafish development

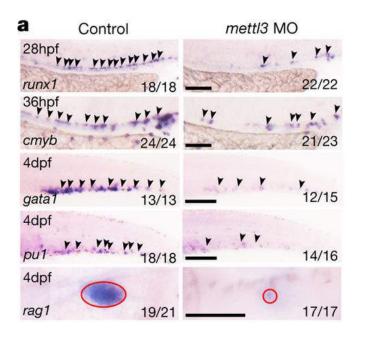

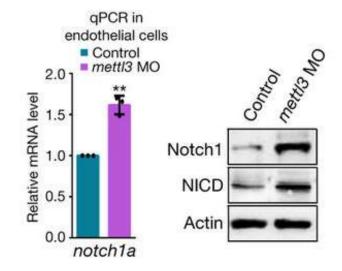

(Zhao et al., 2017 Nature)

### m6A regulates HSC formation through the stability of *notch1* transcripts

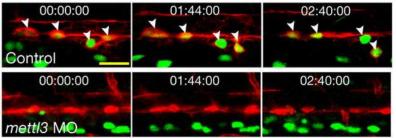

d

kdrl:mCherry;cmyb:EGFP

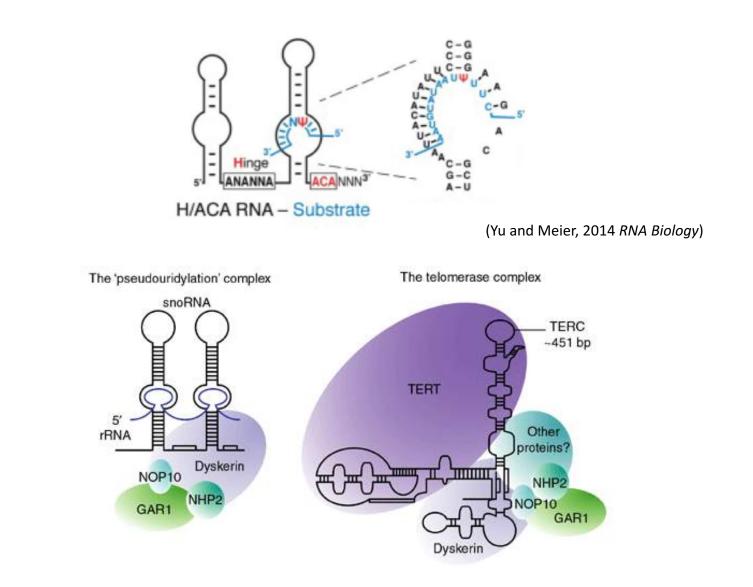

- In the absence of Mettl3 (an m6A wirter) neither HSCs, nor differentiated blood lineages can develop

- overactive Notch1a inhibits the formation of HSCs from endothelial tissue

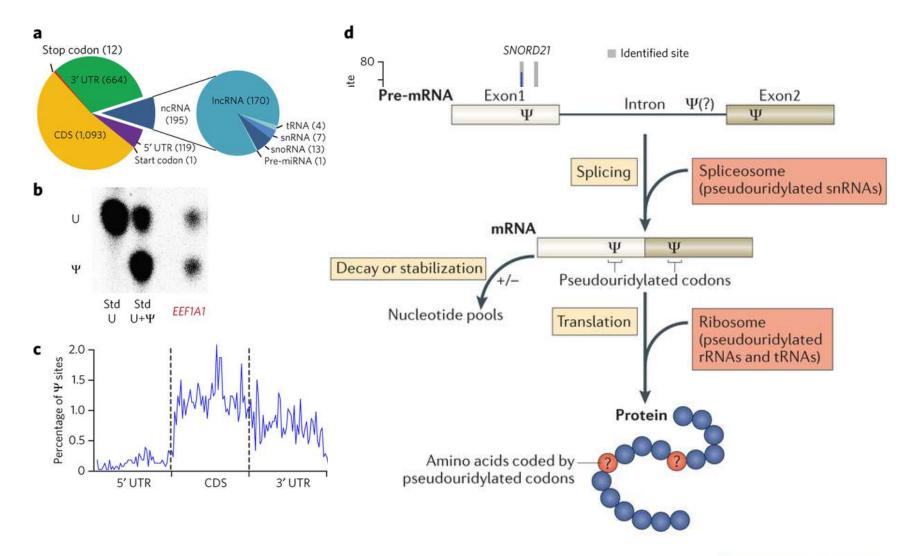

#### Pseudouridylation can be guided by H/ACA-box snoRNAs

#### mRNA contains many pseU sites

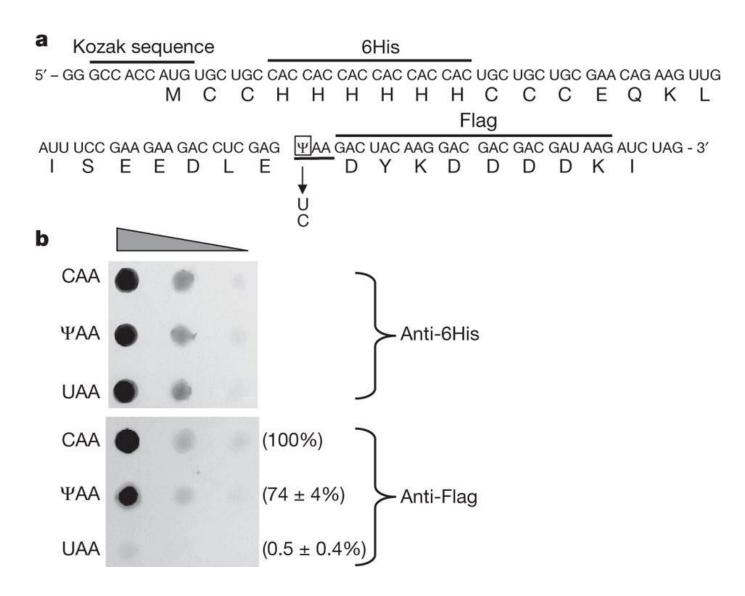

Nature Reviews | Molecular Cell Biology

(Li et al., 2015 Nat Chem Bio)

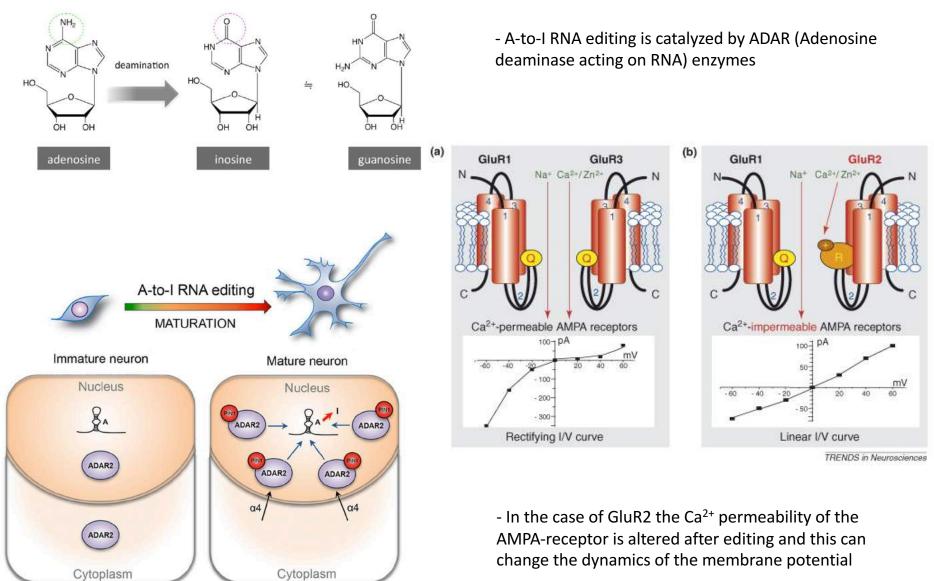

# Pseudouridylation of STOP-codons can result in read-through in yeast

# Adenosine (A) – inosine (I) RNA editing and its srole in neuronal function

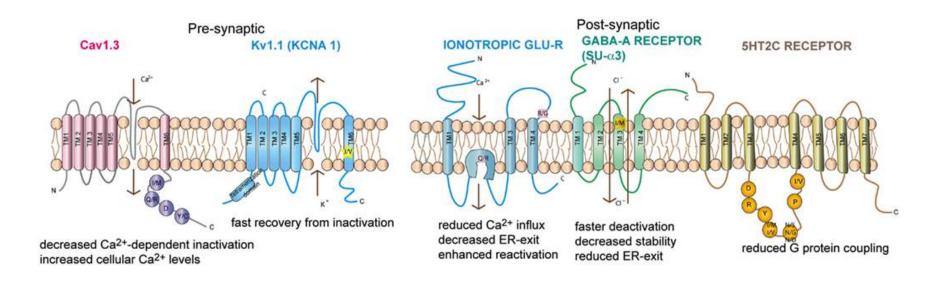

(Behm et al., 2017 J Cell Sci, Liu and Zukin, 2007 Trend Neurosci)

## Adenosine (A) – inosine (I) RNA editing and its srole in neuronal function

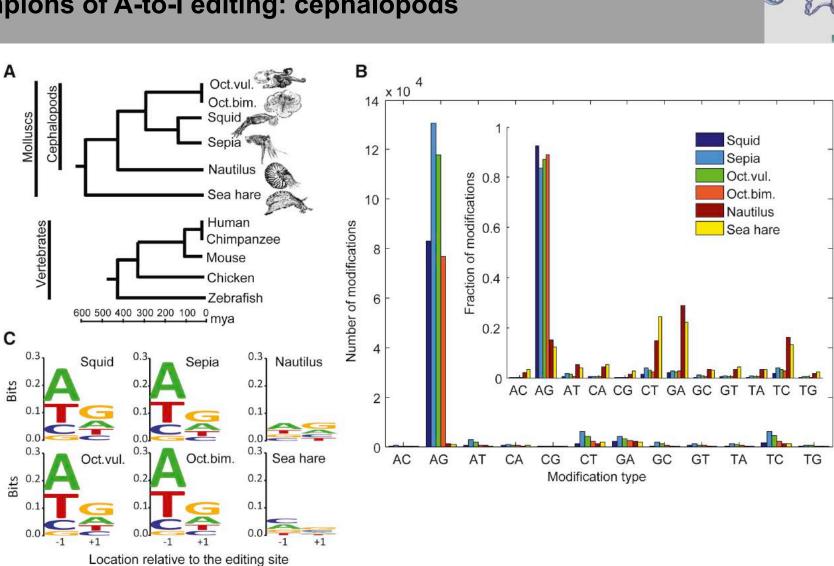

- The properties of many other ion-channels can be changed after RNA-editing

(Tariq and Jantsch, 2012 Frontiers in Neurosci)

### Champions of A-to-I editing: cephalopods

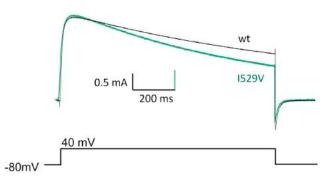

- In the case of Coleoid cephalopods A-to-I editing is the rule

### **Champions of A-to-l editing: cephalopods**

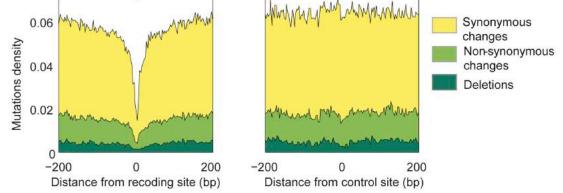

in the second

Sepia K<sub>v</sub>2.1 specific editing site

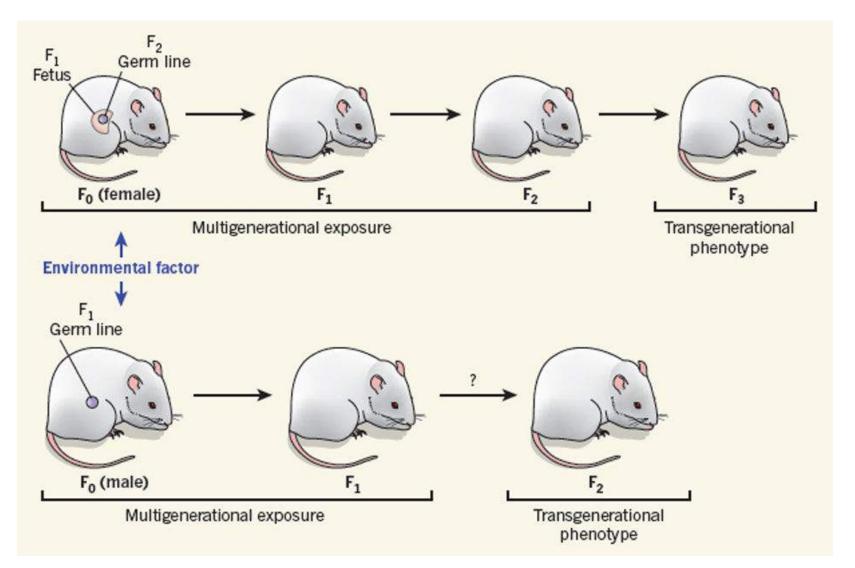

- the  $K_{\!_{\rm V}}2$  potassium channel closes faster as the result of the editing

 A large number of editing-sites are under positive selection, genome evolution is slower in Cephalopods

### The elephant in the room: transgenerational epigenetic modifications

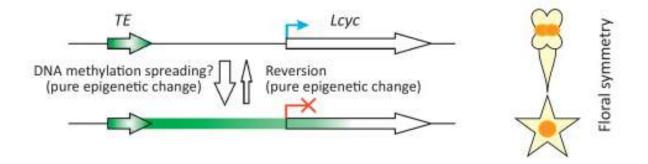

## Toadflax floral symmetry: the oldest example of transgenerational epigenetic inheritence

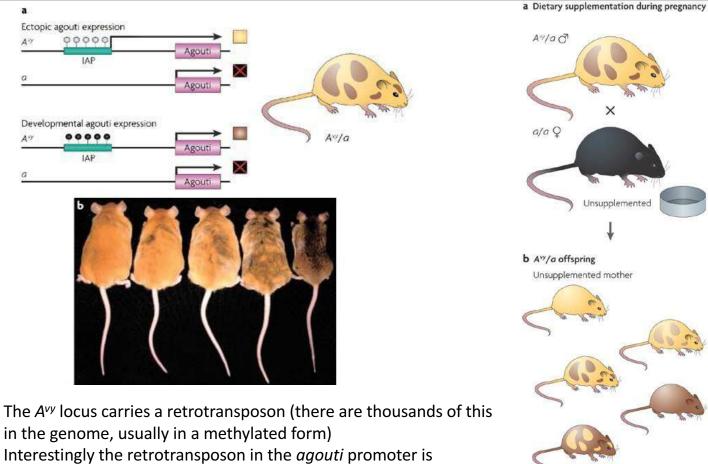

- Toadflax (*Linaria vulgaris*) plants normally have flowers with bilateral symmetry, but some plants have flowers with radial symmetry
- Plants with radial flowers sometimes have offspring with bilateral flowers, but the inheritance pattern is nowhere close to the mendelian ratio
- Floral symmetry is linked to the function of the CYCLOIDEAlike (Lcyc) gene, but this genes seems to be intact in plants with radial flowers!

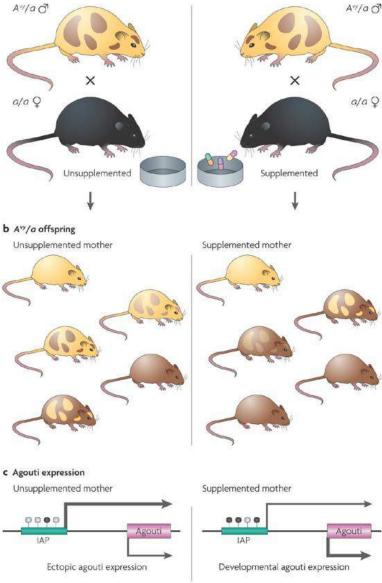

- Expansion in the methylation of a nearby TE can spread into the Lcyc locus

### The agouti color: a classic example for non-mendelian, epigenetic inheritance

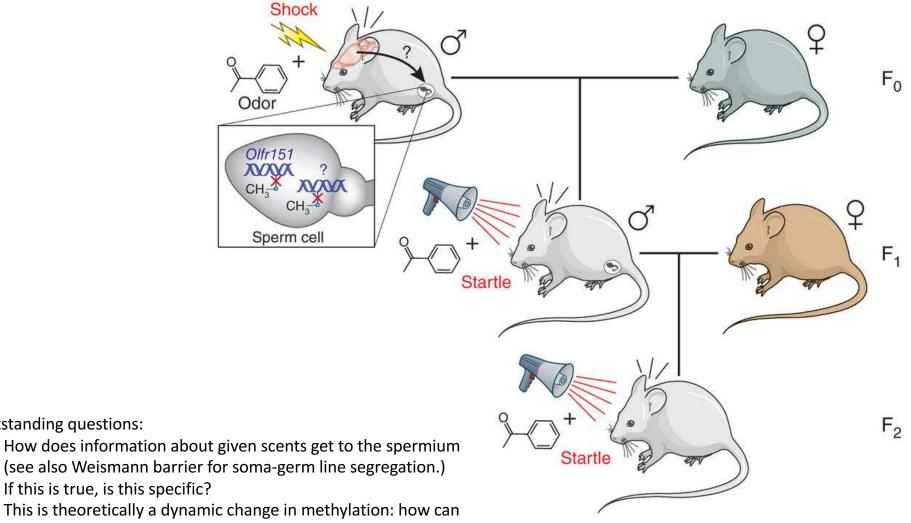

in the genome, usually in a methylated form)

- Interestingly the retrotransposon in the *agouti* promoter is metastable - if it becomes hypomethylated acts as a cryptic constitutive promoter.
- The five mice on the picture have exactly the same allelic combination, their differences are epigenetic
- Agouti mice are not only lighter, but also heavier (pleiotropic effects)

(Jirtle and Skinner, 2007 Nat Rev Gen)

### An esoteric example for transgenerational inheritance: the inheritance of conditional memory

be this protected during the demethylation wave that occurs early in development.

**Outstanding questions:** 

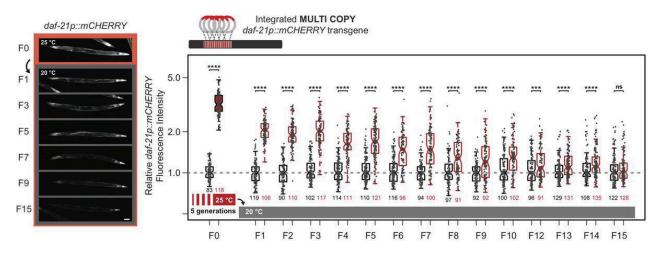

-

-

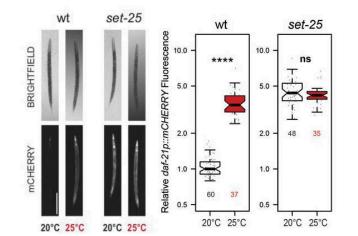

-

# A better undertsood example of transgenerational inheritance in animals

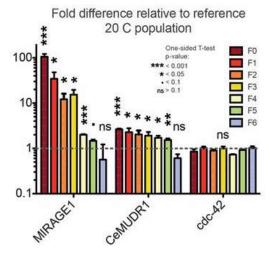

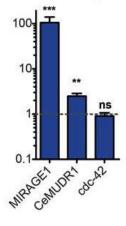

- A heat-shock inducible, multi-copy transgene remains turned on for 14 (!!) generations post heat-shock.

- SET-25: histone methyltransferase, H3K9me3 specific

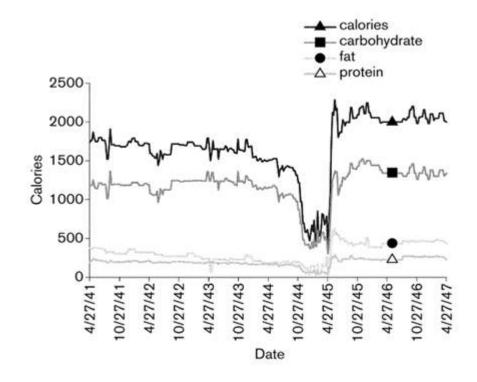

- As a result of the heat-shock a general SET-25 repression occurs (therefore it takes several generations at other loci as well to revert to the original) (Klosin et al., 2017 Science)

#### Human examples: the Dutch Hongerwinter (1944/45)

 - az ez idő alatt embrionális fejlődésben levő gyerekeben felnőtként nagyobb a cukorbetegség, elhízás, kardiovaszkuláris betegségek, bizonyos pszichiátriai problémák gyakorisága

### Human examples: the Dutch Hongerwinter (1944/45)

- Fasting during pregnancy results in the hypomethylation of the DMR region of *IGF2*, what may persist over decades

#### BUT: no significant effect in F2

Table 2. Prevalence of F2 self-reported disease\* according to F1 gender

|                 | F1 exposed | F1 unexposed | All  |

#### (Li and Lumney, 2017 Int J Epid)

### Human examples: Överkalix

- This is correlation between two generation – we have no idea, what is causing it, epigenetics is just one possibility (but the results also could be a statistical fluke due to covariate mining)
